# Examples of XR product/service for rehabilitation

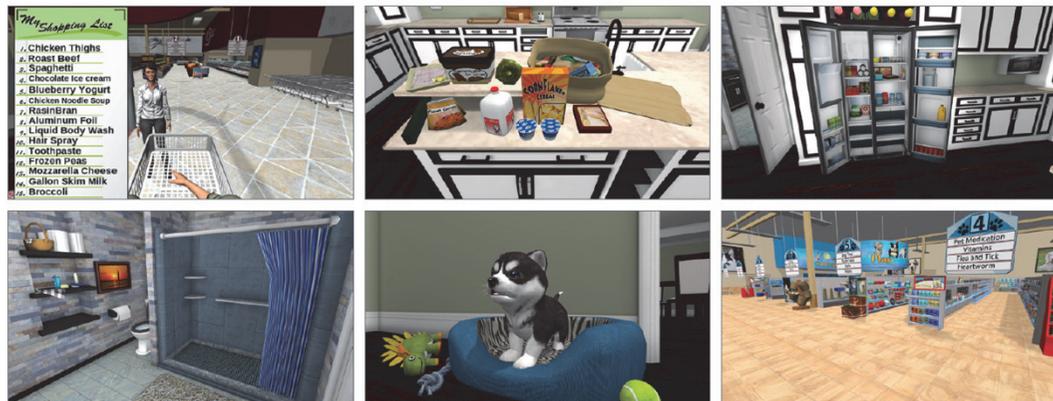

Name	Features	Users	Target body part	Which XR	How to use XR	People involved in XR	Organization	Country	Notes	URL
Physical rehab Service/Product										
XRHealth	(1) Assigned physical therapists proposing VR rehab programs for each disease (2) Improving physical functions through VR games (3) FDA-registered medical VR applications	Broad	Broad (physical, neurological or behavioral symptoms)	VR (HMD)	Execution of rehabilitation programs through VR games	User	XRHealth USA INC	USA	Telerehabilitation	<a href="https://www.xr.health/">https://www.xr.health/</a>
SaeboVR	(1) Designed to engage the client involving daily functional activities through a virtual ADL (activities of daily living) rehabilitation system to help the brain "re-program" itself and form new neural connections (2) Virtual assistant appearing on the screen to educate and facilitate performance by providing real-time feedback (3) FDA-cleared software system	Patients with cognitive or upper limb impairments	Upper limbs	VR (Monitor)	(1) Providing ADL-focused virtual world in which the users incorporates their impaired upper limb to perform simulated self-care tasks that involve picking up, transferring and manipulating virtual objects (2) Using Microsoft Kinect	User	Saebo, Inc	USA	None	<a href="https://www.saebo.com/shop/saebovr/">https://www.saebo.com/shop/saebovr/</a>
MindMotion GO	(1) Gamified neurorehabilitation therapy platform for medium and light severity impairments able to be deployed in the patient's home (2) Including rehabilitation exercises for the upper extremity, trunk, and lower extremity; audio-visual feedback and graphic movement representations for patients (3) FDA-cleared system	Stroke survivors at home	Broad(Upper limbs, torso, lower limbs)	VR (Monitor)	(1) Execution of rehabilitation programs through VR games (2) Using Microsoft Kinect and Leap Motion	User	MindMaze SA	Switzerland	Telerehabilitation	<a href="https://mindmaze.com/digital-therapies-for-neurorehabilitation/mindmotion-telerehab/">https://mindmaze.com/digital-therapies-for-neurorehabilitation/mindmotion-telerehab/</a> <a href="https://www.physiofunction.co.uk/rehabilitation-technology/upper-limb-rehabilitation/mind-motion-go-for-home-use">https://www.physiofunction.co.uk/rehabilitation-technology/upper-limb-rehabilitation/mind-motion-go-for-home-use</a>
MindMotion Pro	(1) Designed for acute neurorehabilitation and ideally suited for delivering table-top therapy to patients recovering from upper-limb hemiparesis (2) Gamification of the exercises (levels of difficulty, rewards, real-time feedback) to maintain patient motivation and to increase the amount of practice (3) FDA-cleared system	Acute stroke patients at hospital	Upper limbs (or )	VR (Monitor)	Project a CG depiction of the nonfunctional one hand, which is controlled by the patient's movement of the working another hand	User	MindMaze SA	Switzerland	None	<a href="https://www.mindmaze.com/digital-therapies-for-neurorehabilitation/">https://www.mindmaze.com/digital-therapies-for-neurorehabilitation/</a>
mediVR KAGURA	Seated reaching motion improving postural balance and dual-task cognitive processing function	Stroke patients	Upper limbs, torso (core)	VR (HMD)	Execution of rehabilitation programs through VR games: horizontal/vertical/Mito-Komon/vegetables/fruits	User	mediVR inc.	Japan	None	<a href="https://www.mediivr.jp/">https://www.mediivr.jp/</a>
RehaVR	Gives the feeling of walking in a grassland or a place with beautiful scenery to increase motivation	Elderly people who wish to improve their motor skills	Lower limbs	VR (HMD, Foot Pedal Exerciser)	Providing virtual environments with beautiful scenery such as sightseeing spots	User	silvereye Inc.	Japan	None	<a href="https://rehavr.com">https://rehavr.com</a>
KiNvis system	Using KiNvis (KiNesthetic illusion induced by visual stimulation) described as the feeling of one's body moving during sensory input, even though the body is actually in a resting state; cognitive stimulation to the embodied brain system for body ownership, a sense of agency, and kinesthetic perception	Patients with chronic stroke	Upper limbs	VR/AR (Monitor/HMD)	(1) Providing visual stimulation which is recorded hand movement in the movement task involving hand opening and closing (2) Applying electrical stimulation while watching the movie during the finger-extension phase.	User	Inter Reha Co.,Ltd.	Japan	None	<a href="https://doi.org/10.3389/fnsys.2019.00076">https://doi.org/10.3389/fnsys.2019.00076</a> <a href="https://www.irc-web.co.jp/kinvis">https://www.irc-web.co.jp/kinvis</a> <a href="https://keio-rehab.jp/efforts/kinvis/">https://keio-rehab.jp/efforts/kinvis/</a>
Prototype/Research										
Phantom motor execution facilitated by ML and AR	Novel plasticity-based, non-invasive treatment for phantom limb pain, in which phantom motor execution is decoded via machine learning, while visualisation of the phantom is accomplished via augmented and virtual reality.	Patients with phantom limb pain	Upper limbs	AR/VR (Monitor)	Preserving the virtual arm in the anatomically correct placement	User	Chalmers University of Technology	Sweden	None	<a href="https://doi.org/10.1016/S0140-6736(16)31598-7">https://doi.org/10.1016/S0140-6736(16)31598-7</a> <a href="https://www.youtube.com/watch?v=ekTJHGC-T4E">https://www.youtube.com/watch?v=ekTJHGC-T4E</a>
Walk Again Project (WAP)	(1) BMI with VR makes the patient's brain reacquire the notion of walking. (2) By walking in a custom-designed exoskeleton with BMI, patients are eventually able to rekindle their remaining nerves to send signals back to brain, and reactivate some voluntary movement and sensitivity.	Paraplegics	Lower limbs	VR (HMD)	Presenting visually the virtual lower limbs through the HMD and the sense of touching the ground through haptic display attached on forearms	User	Duke University	USA	None	<a href="https://qz.com/757516/paraplegics-are-learning-to-walk-again-with-virtual-reality/">https://qz.com/757516/paraplegics-are-learning-to-walk-again-with-virtual-reality/</a> <a href="https://www.youtube.com/watch?v=pb360-Yotac">https://www.youtube.com/watch?v=pb360-Yotac</a>

According to this latest study, the 2021 growth of Virtual Rehabilitation and Telerehabilitation Systems will have significant change from previous year. By the most conservative estimates of global Virtual Rehabilitation and Telerehabilitation Systems market size (most likely outcome) will be a year-over-year revenue growth rate of XX% in 2021, from US\$ 338.3 million in 2020. Over the next five years the Virtual Rehabilitation and Telerehabilitation Systems market will register a 20.1% CAGR in terms of revenue, the global market size will reach US\$ 704.4 million by 2026.

This report presents a comprehensive overview, market shares, and growth opportunities of Virtual Rehabilitation and Telerehabilitation Systems market by product type, application, key players and key regions and countries.

Segmentation by type: breakdown data from 2016 to 2021 in Section 2.3; and forecast to 2026 in section 10.7.

- Physical Rehabilitation
- Neuro Rehabilitation
- Cognitive Rehabilitation
- Others

Segmentation by application: breakdown data from 2016 to 2021, in Section 2.4; and forecast to 2026 in section 10.8.

- Hospitals
- Care Homes
- Home
- Other

**Abstract:** Neurorehabilitation for stroke is important for upper limb motor recovery. Conventional rehabilitation such as occupational therapy has been used, but novel technologies are expected to open new opportunities for better recovery. Virtual reality (VR) is a technology with a set of informatics that provides interactive environments to patients. VR can enhance neuroplasticity and recovery after a stroke by providing more intensive, repetitive, and engaging training due to several advantages, including: (1) tasks with various difficulty levels for rehabilitation, (2) augmented real-time feedback, (3) more immersive and engaging experiences, (4) more standardized rehabilitation, and (5) safe simulation of real-world activities of daily living. In this comprehensive narrative review of the application of VR in motor rehabilitation after stroke, mainly for the upper limbs, we cover: (1) the technologies used in VR rehabilitation, including sensors; (2) the clinical application of and evidence for VR in stroke rehabilitation; and (3) considerations for VR application in stroke rehabilitation. Meta-analyses for upper limb VR rehabilitation after stroke were identified by an online search of Ovid-MEDLINE, Ovid-EMBASE, the Cochrane Library, and KoreaMed. We expect that this review will provide insights into successful clinical applications or trials of VR for motor rehabilitation after stroke.

**Keywords:** virtual reality; stroke; rehabilitation; hemiplegia; recovery of function; neuronal plasticity; sensor

# Review

Table 2. Commercialized VR systems custom-built for upper limb rehabilitation.

VR System	VR Type	Sensor Type	Body Part	Company	Country
Riablo Premium	NI	IMU sensor	Arm	CoRehab	Italy
SaeboVR	NI	Motion-sensing camera (depth sensing, body tracking)	Arm	Saebo	USA
Doctor Kinetic	NI	Motion-sensing camera (depth sensing, body tracking)	Arm	Doctor Kinetic	Netherlands
IREX	NI	Motion sensing with webcam	Arm	GestureTek Health	Canada
Virtual Rehab	NI	Motion-sensing camera (depth sensing, body tracking, and hand tracking)	Arm, hand	Evolv	Spain
XR Health	I	HMD, controller	Arm	XR Health	USA
iWall	NI	Motion-sensing camera (depth sensing, body tracking), touch screen	Arm, hand	CSE Entertainment	Finland
Nirvana	NI	wall or floor touch sensing	Arm, hand	BTS Bioengineering	USA
Myro	NI	Touch screen, touchable objects on screen	Arm, hand	Tyromotion	USA
DIEGO	NI	Hand suspended type	Arm	Tyromotion	USA
AMADEO	NI	Position and force sensor in hand rehab robot	Finger	Tyromotion	USA
Pablo	NI	IMU sensor	Arm, hand	Tyromotion	USA
EsoGLOVE	NI	Hand exoskeleton	Arm, hand, finger	Rocoso Technologies	Singapore
Bimeo PRO	NI	IMU sensor for body, IMU sensor in objects	Arm, hand	Kinestica	Slovenia

This presentation is based on a project, JPNP21501015-0, commissioned by the New Energy and Industrial Technology Development Organization (NEDO) in Japan.

NEDO: National research and development agency that creates innovation by promoting technological development necessary for realization of a sustainable society

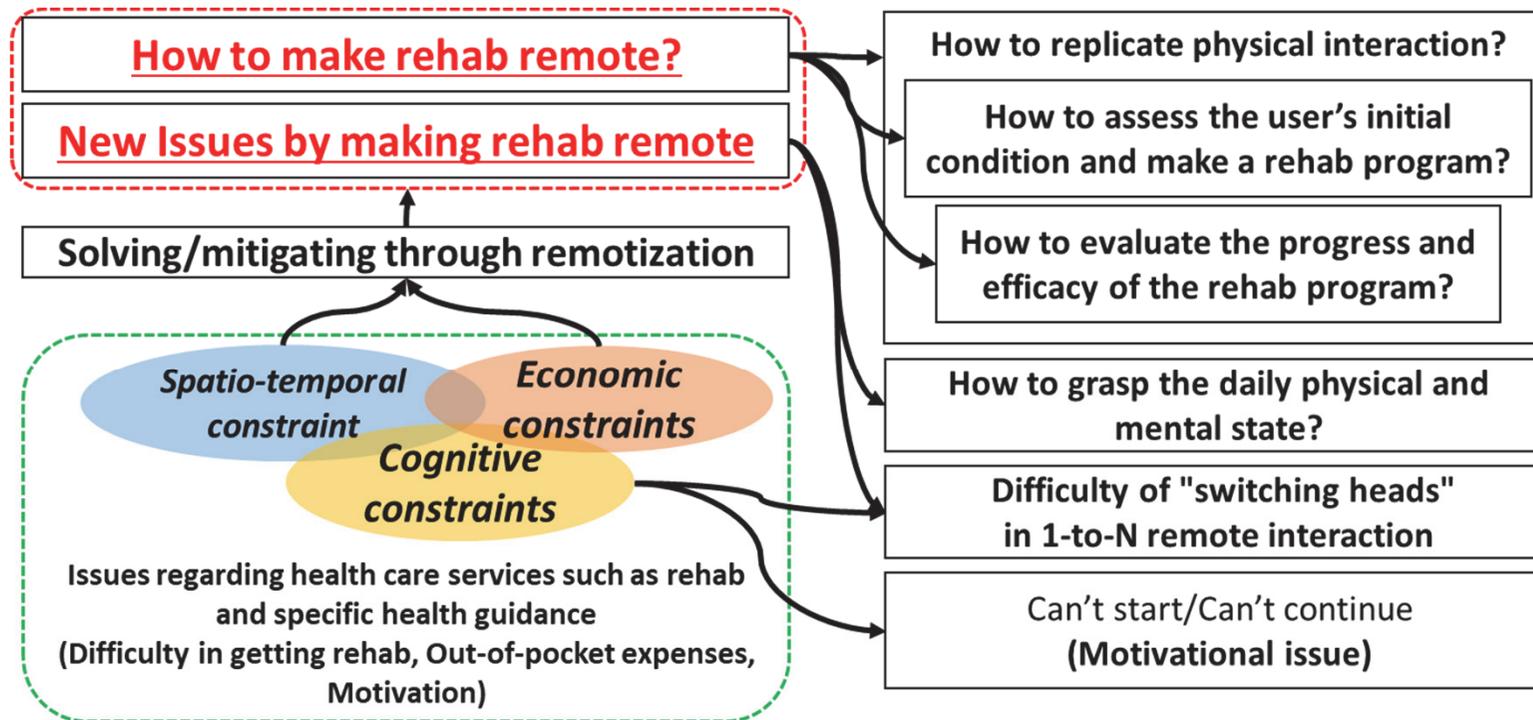

# Background

# Multimodal XR-AI platform development for telerehab and reciprocal care coupling with health guidance

## Purpose

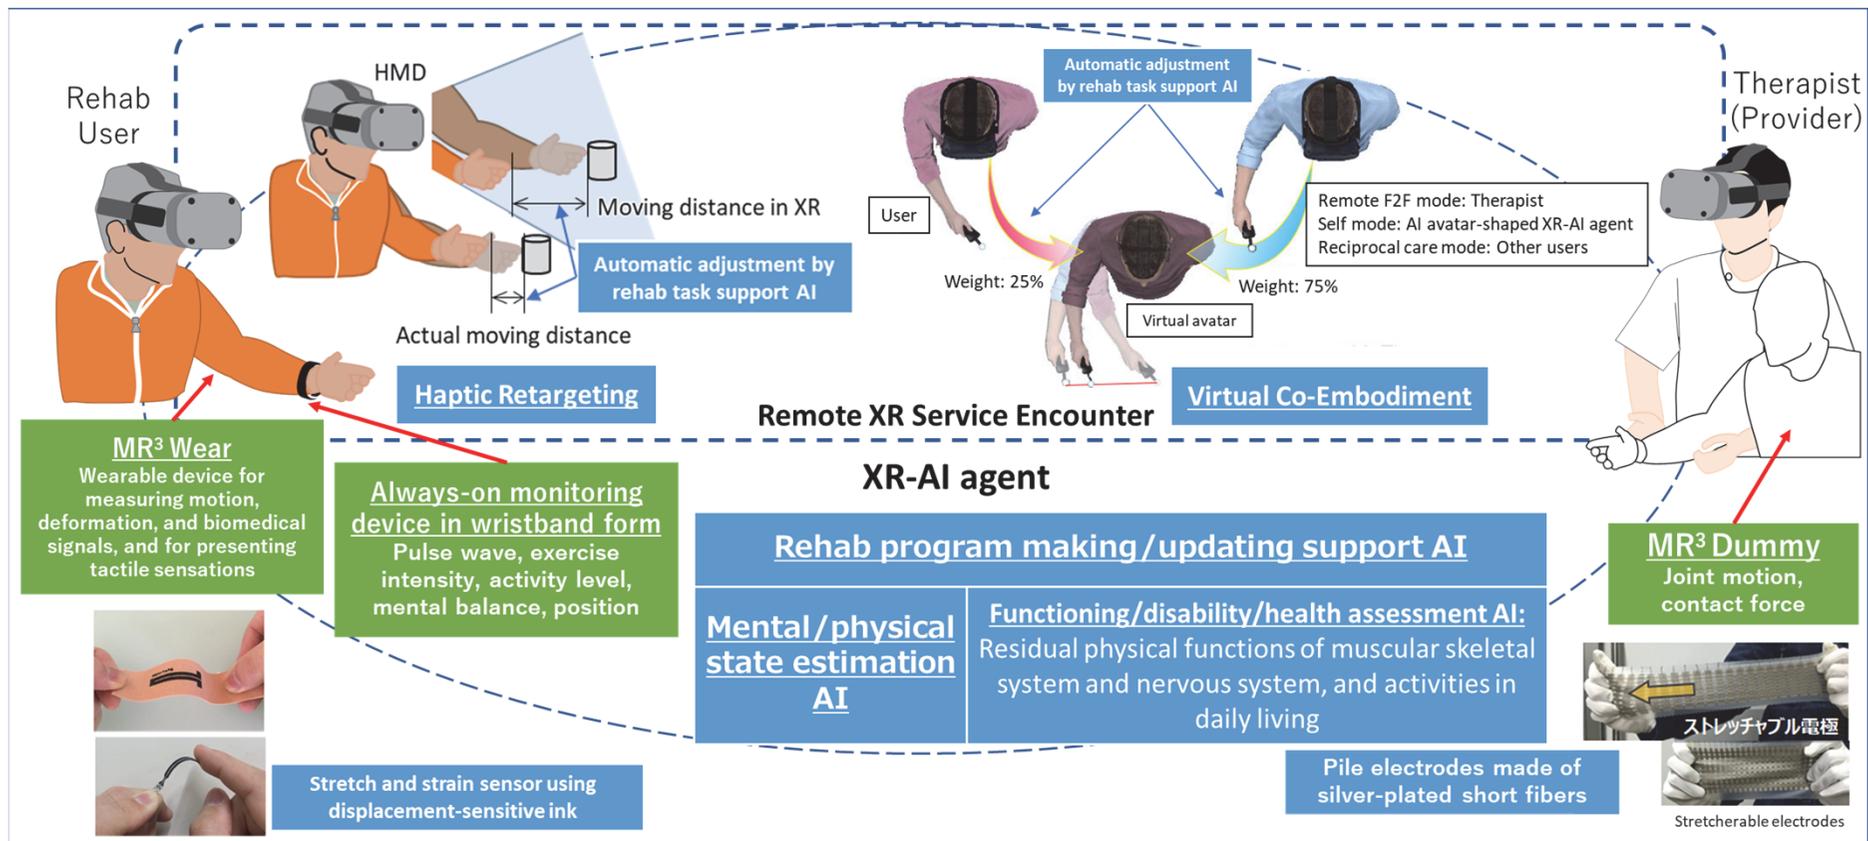

Solve and mitigate issues regarding health care service by alleviating spatio-temporal, economic, and cognitive constraints.

## Keywords

Digital health, 1-to-N interaction, Reciprocal care (0-to-N interaction), Multimodal measurement and intervention

**Approaches** We develop an XR-AI system to estimate mental and physical states through daily measurements, to support the creation and updating of care programs based on detailed assessments of physical functions using MR<sup>3</sup> devices, and to appropriately convert and present the obtained states and care task execution status to remote parties and oneself.

MR<sup>3</sup>: MultiModal Mixed Reality for Remote Rehab (ém œ kjú:b)

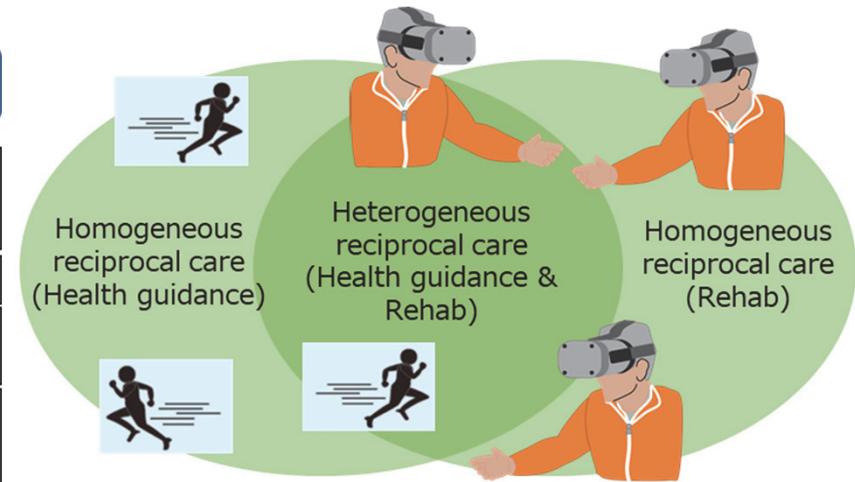

# Expected outputs

- Multimodal XR-AI platform development for telerehab
- Designing 1-to-N and 0-to-N telehealth services

		User	Provider	Both	Prioritized R&D items	R&D items	Others
1-to-N remote service encounter					Mindset switch		
					Care program progress summary/presentation		
Provider training					Reciprocal reflection training		
Care Program	Making				Rehab program making	Health guidance program making	
	Progress assessment/Updating				Functioning/disability/health assessment	Health guidance program progress assessment/Updating	
					Rehab program progress assessment/Updating		
Care task execution	Remote F2F				F2F Telerehab		
	Remote group				Group telerehab		
	Self care				Self rehab	Self training	
	Reciprocal care	Homo				Reciprocal telerehab	Reciprocal teletraining
Hetero					Heterogeneous reciprocal care		
Always-on monitoring					Monitoring in non-walking cases	Workplace monitoring (HPM support)	
					Always-on monitoring, Mental/physical state estimation (walking, activity level, biomedical, Experience sampling)		
					Telerehab	Tele-health guidance	

Multimodal XR-AI platform modules for telehealthcare services

HPM: Health and Productivity Management

0-to-N remote interaction (Reciprocal care for homo/hetero communities)

1-to-N remote interaction (Mindset switch)
